

## MUX– Mirror

The MUX-Mirror Software prevents the loss of data caused by hard disk errors. A disk is mirrored. Should one disk crash, the data on the mirrored disk is still accessible to applications. Furthermore backups can be initiated online, without interrupting user– and application sessions.

### Functions and Benefits

- reliability through mirrored Disks
- online-backup with data consistency
- transparency in application
- dynamic configuration
- selective data mirroring
- fast data synchronisation
- menu based management tools

This Software was developed to ensure full-time access to data.

MUX MirrorDisk supplements the HP-UX operating system. MUX-Mirror can mirror any partition of a disk, including root and swap partitions.

Mirroring of “raw-disk-access” and “file-system-access” is also supported.

The HP-UX– kernel of MUX– Mirror makes it transparent for applications. These can be used without any modification.

MUX– Mirror enables clients/you to remove one disk from a mirrored pair while the other still fulfils the requirements of service applications. Disks will synchronise after the completion of a backup procedure.
